A Model Checker for the Hardest Logic Puzzle Ever

Malvin Gattinger – ILLC, Amsterdam

2016-05-10 – PhDs in Logic VIII – Darmstadt
The Hardest Logic Puzzle Ever

Three gods A, B, and C are called, in some order, True, False, and Random. True always speaks truly, False always speaks falsely, but whether Random speaks truly or falsely is a completely random matter.

Your task is to determine the identities of A, B, and C by asking three yes-no questions; each question must be put to exactly one god.

The gods understand English, but will answer all questions in their own language, in which the words for yes and no are ‘da’ and ‘ja’, in some order. You do not know which word means which.

This version is from (Boolos 1996), for older variants see R. Smullyan: “What is the name of this book.” (1978)
What makes the HLPE hard?

- Who is who? \( \Rightarrow 3! = 6 \) possibilities
- What means what? \( \Rightarrow 2 \) possibilities

\( \Rightarrow 12 \) possibilities:

ja TFR ja TRF ja FRT ja FTR ja RTF ja RFT
da TFR da TRF da FRT da FTR da RTF da RFT

But we can only ask three questions \( \Rightarrow \) distinguish \( 2^3 = 8 \) cases!?

Oh, but we don’t have to learn what means what!

ja TFR

da TFR
Philosopher (B. Rabern and Rabern 2008): Oh, that’s easy, you first ask B whether his answer would be “ja” if you would ask them whether “A” is Random. If they say ‘ja’, then ask C if they would answer ‘ja’ if you would ask them whether they are True. If . . .
WHAT DO WE SAY TO THAT ASSIGNMENT?

NOT TODAY
Can’t we just calculate whether a solution is correct?
"I spend a lot of time on this task. I should write a program automating it!"

**Theory:**

- **Work**
  - Writing code
  - Work on original task
  - Automation takes over

- **Free time**

**Time**
The Plan

1. Find a logic to express HLPE and solutions
2. Implement model checking
3. Profit
Logic to the rescue!

Question and Utterance logic with Agent Types
(Liu and Wang 2013)

A variant of Dynamic Epistemic Logic (DEL)

- **epistemic**: knowledge $K_a$ using the modal logic S5
  “a knows that $\phi$ iff in all worlds a considers possible $\phi$ holds”
- **dynamic**: announcements $[!\phi]$ change the model
  “something is true after announcing $\phi$ iff it is true in $M^\phi$”

with extras:

- **Agency**: $[!_a\phi]\phi$
- **Questions**: $[?_a\phi]$
- **Utterances**: $[!_a u]\phi$
- **Agent Types**: $\eta(a)$
Question and Utterance logic with Agent Types

Syntax:

\[ \phi ::= \top \mid p \mid \neg \phi \mid \phi \land \phi \mid K_a \phi \mid \eta(a) \mid [!a u] \phi \mid [?a \phi] \phi \mid [!a] \phi \mid \]

where \( a \) is an agent (A, B, C), \( \eta \) is a type (True, False, Random) and \( u \) is an utterance (ja, da).

Semantics: Given a model \( M \) with a valuation for propositions, types and utterances, and a current questions \( \mu \) define

\[ M, s \vDash_\mu \phi \iff \ldots \]

Motivation: Model checking HLPE and solutions.
What is a puzzle?

1. A model:

```
TFR yes  FTR yes  RFT yes  FRT yes  RTF yes  TRF yes
  TFR no  FTR no  RFT no  FRT no  RTF no  TRF no
```

2. A goal: $K_i(TFR) \lor \cdots \lor K_i(TRF)$
What is a possible solution? A strategy:

- Ask ...
- If answer is ... then ...

\[ ?_C E_E^*(C \text{ is T}) \rightarrow ?_C E_E^*(B \text{ is R}) \]

ja

\[ ?_B E_B^*(A \text{ is Random}) \]

\[ ?_A E_E^*(C \text{ is T}) \rightarrow ?_A E_E^*(C \text{ is R}) \]

da

Stop.
Implementation 1: HLPE in PQLTTU

What is a possible solution? A strategy:

- Ask ...
- If answer is ... then ...

Every strategy generates a set of sequences:

- Ask $\phi_1$, get answer $\psi^a_1$, ask $\phi^a_2$, get answer $\psi^a_2$ ...
- Ask $\phi_1$, get answer $\psi^b_1$, ask $\phi^b_2$, get answer $\psi^b_2$ ...
- ...

Each sequence gives us a formula saying that it succeeds:

$$[?^a_1] (\langle a \rangle \top \land [?^a_1] !^a_1 \psi^a_1] \ldots [?^a_1] !^a_n \psi^n_n] \theta$$

$$[?^b_1] (\langle a \rangle \top \land [?^b_1] !^b_1 \psi^b_1] \ldots [?^b_1] !^b_n \psi^n_n] \theta$$

$$\vdots$$
From Puzzle Solving to Model Checking

Strategy $\leadsto$ Sequences $\leadsto$ Formulas

Change the question from: “Does this strategy solve the puzzle?” to “Are these formulas valid on the HLPE model?”
Implementation 2: PQLTTU in Haskell

Formulas:

```haskell
data QUForm =
    Top | Prp Prop | AgentName `IsA` AgentType
    | Neg QUForm | Conj [QUForm] | Disj [QUForm]
    | Impl QUForm QUForm
    | K AgentName QUForm
    | C [AgentName] QUForm
    | Say AgentName Utterance QUForm
    | Ask AgentName QUForm QUForm
    | Ans AgentName QUForm
    | DmSay AgentName Utterance QUForm
    | DmAsk AgentName QUForm QUForm
    | DmAns AgentName QUForm

φ ::= ⊤ | p | ¬φ | φ ∧ φ | Kaφ | η(a) | ![u]φ | ![φ]φ | ![a]φ |
Implementation 2: PQLTTU in Haskell

Utterances, Meanings, Models:

type Utterance = String

data Meaning = Mng String (QUForm -> QUForm)

data Model = Mo
  [(World, (Label, TypeLabel, UtteranceLabel))]
  [(AgentName, Partition World)]

  type Scene = (Model, World)

type Context = Maybe (AgentName, QUForm)
Implementation 2: PQLTTU in Haskell

Semantics I:

\[
q\text{IsTrue} \:: \text{Scene} \to \text{Context} \to \text{QUForm} \to \text{Bool}
\]

\[
\begin{align*}
q\text{IsTrue} \_ \_ \_ \text{Top} & = \text{True} \\
q\text{IsTrue} \ sc \_ \_ (\text{Prp} \ p) & = p \ `\text{elem}` \ \text{labelAt} \ sc \\
q\text{IsTrue} \ sc \_ \_ (a `\text{IsA}` \ t) & = \text{typeAtOf} \ sc \ a == t \\
q\text{IsTrue} \ sc \ c \ (\text{Neg} \ f) & = \text{not} \ (q\text{IsTrue} \ sc \ c \ f) \\
q\text{IsTrue} \ sc \ c \ (\text{Conj} \ fs) & = \text{all} \ (q\text{IsTrue} \ sc \ c) \ fs \\
q\text{IsTrue} \ sc \ c \ (\text{Disj} \ fs) & = \text{any} \ (q\text{IsTrue} \ sc \ c) \ fs \\
q\text{IsTrue} \ sc \ c \ (\text{Impl} \ f \ g) & = \text{not} \ (q\text{IsTrue} \ sc \ c \ f) \ || \ q\text{IsTrue} \ sc \ c \ g \\
q\text{IsTrue} \ sc \_ \_ (\text{Ask} \ a \ f \ g) & = q\text{IsTrue} \ sc \ (\text{Just} \ (a,f)) \ g
\end{align*}
\]
Implementation 2: PQLTTU in Haskell

Semantics II:

qIsTrue sc@(m,w) c@(Just (a1,q)) (Say a2 u phi) =
    (a1 == a2) && f `elem` [q,Neg q] && qCanSay sc a1 f
    `implies` qIsTrue (qAnnounce m c a1 u, w) Nothing phi

where
    f = meanfctAtOfGiven sc u q

qAnnounce :: Model -> Context -> AgentName -> Utterance -> Model
qAnnounce oldm@(Mo oldws oldpss) c a u = Mo ws pss where
    ws = filter check oldws
    check (v,_) = qIsTrue (oldm,v) Nothing (agtf a f) where
        AgT _ agtf = typeAtOf (oldm,v) a
        f = meanfctAtOfGiven (oldm,v) u q
        Just (_,q) = c
    pss = map (fmap strip) oldpss
    strip set =
        filter ([]/=) map (filter (`elem` map fst ws)) set
Only one scary Haskell slide left!

https://xkcd.com/1319
Validity and Puzzles:

\[
\text{qIsValid m@}(\text{Mo ws } _ ) f = \\
\quad \text{and } [ \text{qIsTrue (m,w) Nothing f } \mid \text{w } <- \text{map fst ws } ]
\]

\[
\text{type} \quad \text{Puzzle} \quad = \quad (\text{Model}, \text{QUForm})
\]
\[
\text{type} \quad \text{Question} \quad = \quad (\text{AgentName}, \text{QUForm})
\]
\[
\text{data} \quad \text{Strategy} \quad = \\
\quad \text{FState} \\
\quad \mid \quad \text{QState} \quad \text{Question} \\
\quad \quad [(\text{Utterance}, \text{Strategy})]
\]

\[
\text{solves :: Strategy } \to \text{ Puzzle } \to \text{ Bool}
\]
\[
\text{solves strategy (model,goal) } = \text{ all}
\quad (\text{qIsValid model . seq2f goal})
\quad (\text{sequencesOf strategy})
\]

Solving HLPE in a second

GHCi, version 7.10.3: http://www.haskell.org/ghc/
...
Ok, modules loaded: QULogic, HELP, AGTYPES.

*QULogic> rabern
Ask B if >>[B?(A is a LT)]<B: ja>T<<.
   If they say 'ja', then:
   Ask C if >>[C?(C is a TT)]<C: ja>T<<.
      No matter what they say, :
      Ask C if >>[C?(B is a LT)]<C: ja>T<<.
         No matter what they say, stop.
   If they say 'da', then:
   Ask A if >>[A?(A is a TT)]<A: ja>T<<.
      No matter what they say, :
      Ask A if >>[A?(B is a LT)]<A: ja>T<<.
         No matter what they say, stop.

*QULogic> rabern `solves` hlpe
True
(0.07 secs, 13,475,456 bytes)
Future Work

- bounded search
  - find solutions automatically
  - verify unsolvability
- implement translations to PAL
  - performance?
- automatically generate puzzles and solutions
- more agent types
  - “... giraffe always answers to the previous question ...”
